Method for preparing nucleic acid sample for analyzing minor gene,
nucleic acid sample thus prepared and method for analyzing nucleic
acid sample by using the same, and reagent kit and analysis service
for using the same

```
The present invention provides the protein and coding sequences of human halfs protein 16. The sequences can be used in the treatment of haematogenic cancer, immune diseases, dysplasia, phlogosis and HIV infection. The present sequence is a probe for the coding sequence of the
                                                                                                                                                                                                                                                                                                                                                                         Human HS1 protein 16 and encoded polynucleotide, used in diagnosis and treatment of malignant tumors, hemopathy, human immunodeficiency virus infection, immunological diseases and inflammation -

                                                                                                                                                                                                                   The present invention describes a novel method for determining the risk of or diagnosing Alzheimer's disease using single nucleotide polymorphisms (SNPs) present in an individual's mitochondrial DNA (mrDNA). In additon, the SNPs identified can be used to identify agents suitable for use in treating Alzheimer's disease. Sequences

The present invention describes a method for the quantification of extramitochondrial DNA (exmtDNA) by determining the ratio of a first and second biological sample containing exmtDNA and mitochondrial DNA (mtDNA) to determine the risk or presence of a disease associated with altered mitochondrial function. The method can be used to determine

the risk of or presence of a disease associated with altered mitochondrial function, especially Alzheimer's disease, Huntington's disease, Parkinson's disease, dystonia, schizophrenia, non-insulin dependent diabetes mellitus, mitochondrial encephalopathy, lactic acidosis, stroke, myoclonic epilepsy ragged red fibre syndrome and Leber's hereditary optic neuropathy. The method can also be used to identify agents suitable for treating such diseases, in particular Alzheimer's disease. ABS57202 to AAS57313 represent unlochide sequences used in the exemplification of the present invention. More specifically AAS57206 to AAS57313 are PCR primers used in the detection of exmtDNA and mtDNA. 8888888888888888

```
The invention relates to an isolated SH3 domain (POSH)-like signalling corpute in (POSHL 1) polypeptide (I), comprising a sequence of 730 amino acids (SL, ABBB3939), a sequence having 65% sequence identity to (S1), (S1) having 95% deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSHL 1 is a proto-oncogene/oncogene product that functions as an adaptor protein that interacts with Rho family small GTPases as well as commistream components of the signal transduction pathway. (I) is useful considered expression of human POSHL1 including disease and treating caused by altered expression of human POSHL1 including diagnosing and creating cancer, they useful in the development of vaccines and (II) is useful in gene therapy. (II) is useful for constructing microarrays which are useful for measuring and for surveying gene expression and creating creates sequence is that of a scanning oligonucleotide useful in examples of the minention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel human SH3 domain (POSH)-like signalling protein 1 polypeptide, POSHL-1, useful for treating disorders associated with decreased expression or activity of human POSHL1 -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Example 2; SEQ ID NO 3329; 60pp + Sequence Listing; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   WPI; 2002-684061/74.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Shannon M;
protein 1 (POSHL 1) polypeptide (1), comprising a sequence of 730 amino acids (S1, ABB8399), a sequence having 65% sequence identity to (S1), acids (S1, ABB8399), a sequence having 65% sequence identity to (S1), acids (S1, ABB8399), a sequence having 65% sequence identity to (S1), acids for a protein the fact of the sequence comprising at least 8 contiguous amino acids. Human POSHL 1 is a prote-oncogene/oncogene product that functions as an adaptor protein that interacts with Rho family small GTPaeses as well as downstream components of the signal transduction pathway. (I) is useful for identifying a specific binding partner. (I) and nucleic acids (II) considered by altered expression of human POSHL including diagnosing and treating caused by altered expression of human POSHL including diagnosing and treating caused by altered expression of human POSHL including diagnosing and treating caused by altered expression of human POSHL including microarrays which are useful in gene therapy. (II) is useful for constructing microarrays which are useful in measuring and for surveying gene expression and creating transgent, non-human animals capable of producing the proteins. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Note: The present sequence did not form part of the printed specification, but is based on sequence information supplied to Derwent

                                             Note: The present sequence did not form part of the printed specification, but is based on sequence information supplied to Derwent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        modulating a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     pCR primers AAF79922-27 were used to amplify sequences from the 3' end of cDNA encoding human and murine GL50 polypeptides. GL50 molecules are antigens on the surface of antigen presenting cells, which costimulate T cell proliferation and bind to costimulatory receptor ligands on T cells. GL50 modulating agents are used to modulate an immune response in a subject. GL50 polypeptides are used to condulate T cell costimulation, and to reduce the proliferation of a tumour cell. Diseases that can be treated using GL50 molecules are graft-versue-host disease, autoimmune disease, allergies, acquired immune deficiency syndrome (ALDS), and viral infections. The GL50 molecules can be used in vaccines. GL50 polynucleotides can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                 PCR primer used to amplify human and murine GL50 cDNA sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated nucleic acid encoding a GL50 polypeptide for modula
immune response and reducing the proliferation of a tumour cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ..

The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSHL 1) polypeptide (I), comprising a sequence of 730 amino acids (SI, ABB83999), a sequence having 65% sequence identity to (S1), (S1) having 95% deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous anino acids. Human POSHL 1 is a proto-oncogene/oncogene product that functions as an adaptor protein that interacts with Rho family small GTPases as well as adaptor protein that interacts with Rho family small GTPases as well for identifying a specific binding partner. (I) and nucleic acids (II) encoding (I) are useful for diagnosing, monitoring disease and treating caused by altered expression of human POSHL1 including diagnosing and treating cancer, they useful in the development of vaccines and (II) is useful in gene therapy. (II) is useful for constructing microarrays which are useful for measuring and for surveying gene expression and creating

```
The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSHL 1) polypeptide (I), comprising a sequence of 730 amino acids (SI, ABB83999), a sequence having 65% sequence identity to (SI), (S1) having 95% deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSHL 1 is a proto-oncogene/oncogene product that functions as an adaptor protein that interacts with Rho family small Grases as well as downstream components of the signal transduction pathway. (I) is useful for identifying a specific binding partner. (I) and nucleic acids (II) encoding (I) are useful for diagnosing, monitoring disease and treating caused by altered expression of human POSHL1 including diagnosing and treating cancer, they useful in the development of vaccines and (II) is useful in gene therapy. (II) is useful for constructing microarrays which are useful for measuring and for surveying gene expression and creating transgenic non-human animals capable of producing the proteins. The present sequence is that of a scanning oligonucleotide useful in examples of the invention.
                                                                                                                                                                                                                                                                                                                                      Human; POSHL 1; SH3 domain; POSH-like signalling protein 1; oncogene; Rho GTPase; signal transduction; gene expression; cancer; vaccine;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention provides a method for identifying a set of extendible primers which can be used in the identification, typing and classification of genes. This can then be used to predict protein sequence and structure, in organ donation to match the organ with the receiver, and to identify bacteria in a sample. The method can be used type the human leukocyte antigen genes (HLA) and 16s rRNA genes in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Identifying extendible primers for use in identification, or classification of a nucleic acid of an organism, allele or gene such a class 1/2 HLA comprises identifying all possible nucleotide sequences

                                          The present invention provides a method for identifying a set of extendible primers which can be used in the identification, typing and classification of genes. This can then be used to predict protein sequence and structure, in organ donation to match the organ with the receiver, and to identify bacteria in a sample. The method can be used to type the human leukocyte antigen genes (HLA) and 16s rRNA genes in

New polypeptides, designated as NOVX, useful for diagnosing and treating infections, neurological diseases, cancer, allergy, and bone, immunological, skin, renal, brain, muscle and autoimmune disorders -

Example 3; Page 659; 672pp; English.

The invention relates to a novel isolated polypeptide, designated NOVX (NOV1 - 33), consisting of a mature form of one of 61 sequences, given in the specification, or its variant, where amino acid residue(s) in the variant differ from the mature form, provided that the variant differs in the mature form or more than 15 % of the amino acids from the sequence of the mature in now more than 15 % of the amino acids from the sequence of the mature form. The NOVX polypeptides, nucleic acids encoding the polypeptides, and an antibody to the polypeptides, are useful for treating or preventing NOVX-associated disorder. NOVX-associated disorder. NOVX polypeptides and the encoding nucleic acids, are useful for determining the presence of or predisposition to a disease associated with altered levels of NOVX polypeptide and polynucleotide, by measuring the level of polypeptide expression or the amount of nucleic acid from a mammal and comparing it with another mammal not having or not predisposed to the disease. NOVX and a cell expressing NOVX is useful for identifying an agent that that an or not acid the expression or activity of NOVX. The antibodies and a modulates the expression or activity of NOVX. The antibodies and a

```
CC for treating a pathological state in a mammal. The antibodies are useful for tereating a pathological state in a mammal. The antibodies are also useful for determining the presence or amount of NoVX in a sample. NOVX polypeptides, polymucleotides and antibodies specific for the polypeptides, polymucleotides and antibodies specific for the cc including trauma, viral, bacterial, fungal, protozoal, and parasitic infections. They can also treat disorders such as e.g., Alzheimer's disease or a stroke. The NOVX encoding nucleic acids are useful for expressing the NOVX proteins, to detect NOVX mRNA, or a genetic lesion in a now y sequences to move a NOVX gene and to medulate NOVX activity. NOVX sequences are also useful for identifying a cell or tissue type in a biological sample, to amplify DNA sequences from very small biological samples such as tissues e.g. hair or skin or body fluids in forensic biology and as primers and probes for use in identifying and/or cloning NOVX homologues in other cell types. The NOVX proteins are useful for diagnostically monitoring protein levels and modulating NOVX activity. Cells comprising NOVX nucleic acids are useful for producing non-human transgenic animals which are useful for studying the function and/or activity. Cells NOVX protein and for identifying and/or evaluating modulators of NOVX protein activity. The NOVX nucleic acids candor evaluating modulators of NOVX protein activity. The NOVX nucleic acids candor evaluating modulators of NOVX protein activity. The NOVX nucleic represents a NOVX PCR primer of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ·.

EDA is an X-chromosomal recessive disorder linked with the absence or hypoplasia of hair, teeth and sweat glands. The EDA gene has been mapped to Xqi2-qi3 by genetic linkage analysis using restriction fragment length polymorphisms (RFLP) markers. Translocation breakpoints were also used to define the localisation of the gene as well as the recovery of yeast artificial chromosome (XAC) clones from the region using RFLP markers and new unique markers. AAT46079-92 are primers for sequence-tagged sites associated with the anhidrotic ectodermal dysplasia (EDA) gene. AAT46083-92 are associated with new markers labelled sWXD632, sWXD178, sWXD634, sWXD635 and sWXD636.
                                                                                                                                                                       detecting extranuclear DNA consisting of a single-strand with a double-stranded stem-loop structure containing at least 2 binding sites for DNA binding proteins. The method can be used to detect cancer cells in tissue sections, biopsies, body fluids etc, and can be used in the diagnosis and monitoring of cancer. The present sequence is an oligonucleotide used to detect AML leukaemia cells in a demonstration of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         STS; sequence-tagged site; primer; EDA; anhidrotic ectodermal dysplasia; yeast artificial chromosome; Homo sapiens; 88.
                                                                  Detecting tunnor cells from presence of specific stem-loop DNA molecules outside the nucleus, useful for diagnosis and monitoring of tumors -
                                                                                                                                                        The present invention relates to a method of detecting tumour cells, by

This invention describes a novel method for identifying an inhibitor potentially useful for treatment of cancer, where the inhibitor is active on a gene vital for cell growth or viability, and where the gene is subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is used for preventing the development of cancer in a patient having a precancerous condition, by administering to the patient a first allele present in cells of the precancerous condition, where the normal somatic cells of the patient are heterozygous for the first gene, the inhibitor is active on at least one but less than all allelic forms of the gene present in a population and targets only one allelic forms of the gene normal somatic cells, and the first gene. The products and methods can be used in the diagnosis, prevention and treatment of LOH disorders,

(STS'8) in the search for the sequence encoding the human anhidrotic ectodermal dysplasia (EDA) gene (AAV05851). This primer is used to amplify the STS at locus DXS339. The amplified fragments can be used to amplify the STS at locus DXS339. The amplified fragments can be used to the region Xq12-q13 by genetic linkage analysis and has been mapped to the region Xq12-q13 by genetic linkage analysis and has been shown to contain a 200 kb intron inserted in the 3' end of the coding sequence. Deficiencies in the gene are observed by translocations with a breakpoint in the transcribed CpG island 3 at the Xq12-q13 locus. The EDA gene can be used to study the dynamics of EDA gene expression during foetal development, and processes affecting normal hair growth in adults. The EDA gene can also be used to study hair, sweat gland and tooth formation and growth, and ectodermal dysplasias.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Primers AAV05858-V05879 were used to PCR amplify sequence tagged sites (STS^{\prime},s) in the search for the sequence encoding the human anhidrotic

```
The invention describes a polynucleotide (I) of the endothelin (EDNR) fendothelin converting enzyme (ECE)/receptors of EDN and ECE (EDNR) signaling system which is associated with a cardiovascular disease. (I), the gene encoding EDN. ECE or EDNR (II) or a vector (III) expressing (I) or (III) is useful for producing cells capable of expressing a molecular variant polypeptide which is associated with a cardiovascular disease. (II), (III), the EDN. ECE or EDNR polypeptide of expressing and cotaining a pro-drug or drug capable of modulating the activity of a molecular variant of a polypeptide of the EDN/EDNR/ECE signaling system or its gene product. The isolated proteins and correctly avariant of a polypeptide of the EDN/EDNR/ECE signaling system or its gene product. The isolated proteins and palamaceutical composition for treating a cardiovascular disease such as coronary heart disease, hypertension, atherosclerosis, or related to abnormal nagiogenesis or fatty acid metabolism e.g. diabetes and familial chapters and manipulating system are useful as forensic markers, for constitution a nimal and in creation of a solid support
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      comprising polymucleotides, genes, vectors, polypeptides, antibodies or host cells of the invention. This sequence represents a PCR primer used to identify single nucleotide polymorphisms in DNA encoding cardiovascular regulator proteins of the EDN/RCE/EDNR signaling pathway.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The invention describes a polynucleotide (1) of the endothelin (EDN)/endothelin converting enzyme (ECE)/receptors of EDN and ECE (EDNR) (Signaling system which is associated with a cardiovascular disease. (I), the gene encoding EDN, EDE OF EDNR (II) or a vector (III) expressing in converting EDN, EDN (ELS) or (II) expressing a molecular polypeptide which is associated with a cardiovascular disease. (II), (III), the EDN, ECE or EDNR (II) is useful for identifying and a molecular variant gene comprising (I) is useful for identifying and cohraining a pro-drug or drug capable of modulating the activity of a molecular variant of a polypeptide of the EDN/EDNR/ECE signaling system or its gene product, or for identifying and obtaining an inhibitor of the activity of a molecular variant of a polypeptide of the EDN/EDNR/ECE signaling system or its gene product. The isolated proteins and polymucleotides encoding them are useful for preparation of a polymucleotides encoding them are useful for preparation of a polymucleotides encoding them are useful for preparation of a polymucleotides encoding them are useful for preparation of a polymucleotides encoding them are useful for preparation of a polymucleotides encoding them are useful for preparation of a polymucleotides encoding them are useful for preparation of a polymucleotides encoding them are useful for preparation of a polymucleotides encoding them are useful for preparation of a polymucleotides encoding them are useful for preparation of a polymucleotides encoding them are useful for preparation of a polymucleotides encoding them are useful for preparation of a polymucleotides encoding them are useful for preparation of a polymucleotides encoding them are useful for preparation of a polymucleotides encoding them are useful for preparation of a polymucleotides encoding them are useful for preparation of a polymetry of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    coronary heart disease, hypertension, atherosclerosis, or related to abnormal angiogenesis or fatty acid metabolism e.g. diabetes and familial hypercholesterolaemia. The gene or a polynuclectide fragment of the EDN/ECE/EDNR signaling system are useful as forensic markers, for creating a transgenic animal and in creation of a solid support comprising polynuclectides, genes, vectors, polypeptides, antibodies or host cells of the invention. This sequence represents a PCR primer used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    to identify single nucleotide polymorphisms in DNA encoding cardiovascular regulator proteins of the EDN/ECE/EDNR signaling pathway.
                                                                                                                                                                                                                                                                                                  Endothelin; EDN; endothelin converting enzyme; ECE; endothelin receptor; EDNR; signaling system; cardiovascular disease; coronary heart disease; hypertension; atherosclerosis; angiogenesis; fatty acid metabolism; diabetes; familial hypercholesterolaemia; forensic marker; transgenic animal; solid support; cardiovascular regulator; SNP; single nucleotide polymorphism; PCR; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel polynucleotide of the endothelin/endothelin converting enzyme/receptors of endothelin and endothelin converting enzyme signaling system associated with cardiovascular disease, useful for
                                                                                                                                                                                                                                            Endothelin converting enzyme 1 (ECE-1) SNP detection primer #66.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 21 BP; 1 A; 11 C; 3 G; 6 T; 0 other;

RESULT 20

AAV48107

Beta-globin fusion primer 18.155.

(first entry)

27-OCT-1998

AAV48107;

```
The primers AAV48107 and AAV48108 were used in the synthesis of a specific probin fusion construct. This was used in the selection of a specific protein or RNA, by in virto or in situ translation of candidate RNA molecules to produce RNA-protein fusions, then selecting specific RNA protein fusions. The method is used to select proteins (or DNA encoding reagents, to identify improved human antibodies or new enzymes. Prese proteins are potentially useful in diagnosis and therapy, or as maplification to be performed, resulting in enrichment of selection and amplification to be performed, resulting in enrichment of even very rare molecules and allowing isolation of proteins that bind specifically to
                                                                                                                                                                                                                                                                                                                                                                                                                                          Selection of specific protein by screening protein-RNA fusions generated in vitro or in situ - useful for, e.g. identifying enzymes and antibodies with altered properties, potentially useful as catalysts or for therapy or diagnosis
                                                                                                          In situ translation, RNA-protein fusion, binding reagent, antibody; industrial catalyst, ss; PCR; primer; amplification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Length 18;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            almost any compound or catalyse almost any reaction.

The present sequence is a primer which was used to generate beta-globin CDNA from mRNA by reverse transcription. The CDNA was used in a method for generating beta-globin NAN-protein fusions. RNA-protein fusions comprise a protein covalently linked to the 3' end of its own mRNA. The fusions are made by synthesis and in vitro or in situ translation of an mRNA molecule with a peptide acceptor attached to its 3' end. The RNA-protein fusions are incubated under high salt conditions to produce a protein library. This method is useful for improving or altering existing proteins, as well as for isolating new proteins and nucleic acid or small molecule targets. It may also be used to improve human or humanised single-chain antibodies for the treatment of a number of diseases. The method is useful for the isolation of proteins with specific binding properties, for screening cDNA libraries and cloning new genes on the basis of protein-protein interactions. Unlike prior
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Polymorphism; human, inhibitor; cancer; treatment; cell growth; LOH; cell viability; loss of heterozygosity; precancerous condition; ASI; allele specific inhibitor; somatic cell; diagnosis; prevention; atherosclerotic plaque; premalugnant metaplastic lesion; endometriosis; dysplastic lesion; benign tumour; polycystic kidney disease; transplant; graft versus host disease; malignant cell removal; bone marrow; ss.

                                                                                                                                                                                                                                                                                                                             potentially useful for treatment of cancer, where the inhibitor is active on a gene vital for cell growth or viability, and where the gene is subject to loss of heterozygosity (LOM) in a cancer. The inhibitor is used for preventing the development of cancer in a patient having a precancerous condition, by administering to the patient a first allele specific inhibitor (ASI) targeted to an allele of a first essential gene present in cells of the precancerous condition, where the normal somatic cells of the precancerous condition, where the normal somatic is active on at least one but less than all allelic forms of the gene present in a population and targets only one allelic forms of the gene normal somatic cells, and the first gene. The products and methods can be used in the diagnosis, prevention and treatment of LOH disorders,

The present invention describes a novel method for determining the risk of or diagnosing Alzheimer's disease using single nucleotide polymorphisms (SNPs) present in an individual's mitochondrial DNA (mtDNA). In additon, the SNPs identified can be used to identify agents suitable for use in treating Alzheimer's disease. Sequences AAC67301-C67610 are PCR primers used to demonstrate the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes a method for the quantification of extramitochondrial DNA (exmtDNA) by determining the ratio of a first and second biological sample containing exmtDNA and mitochondrial DNA (mtDNA) to determine the risk or presence of a disease associated with altered mitochondrial function. The method can be used to determine the risk of or presence of a disease associated with altered mitochondrial function, especially Alzheimer's disease, Huntington's disease, Parkinson's disease, dystonia, schizophrenia, non-insulin dependent diabetes mellitus, mitochondrial encephalopathy, lactic acidosis, stroke, myoclonic epilepsy ragged red fibre syndrome and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        diagnosis, quantification, detection, dystonia, Alzheimer's disease, Huntington's disease, Parkinson's disease, schizophrenia, stroke, non-insulin dependent diabetes mellitus; mitochondrial encephalopathy, lactic acidosis; myoclonic epilepsy ragged red fibre syndrome;

Leber's hereditary optic neuropathy. The method can also be used to identify agents suitable for treating such diseases, in particular Albeheimer's disease. AR57202 to AAS57313 represent nucleotide sequences used in the exemplification of the present invention. More specifically AAS57206 to AAS57313 are PCR primers used in the detection of exmtDNA

The sAg is used to enhance production of VH, especially VH3, restricted Abs. To detect Ig gamma chain expression, the antisense sequence given in AAQ64857 was used as probe. Detection of VH families used the sense oligonucleotides given in AAQ64858-60. (Updated on 25-MAR-2003 to correct PN field.)

                                           This sequence is used to describe a method for reducing cross-contamination during the amplification of muleic acids in a sample. The method involves (i) treating the sample with an enzyme that degrades nucleic acids from other amplification reactions; (ii) inactivating the enzyme; and (iii) amplifying the nucleic acids in the presence of a reagent that inhibits reactivation of the enzyme. N-lauroylsarcosine is used to inhibit reactivation of the uracil-N-glycosylase (UNG). The new method prevents cross-contamination from amplification products containing artificially introduced durpunits by using UNG and inhibiting reactivation of the UNG as above eliminates false negatives.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

```
fucosyltransferase coding sequences, particularly FUT3 and FUT6. These antisense sequences can be used in the treatment of cancer, especially colon, pancreatic, ovarian, gastric, brast, lung, hepatocellular, prostate, bladder, renal cell and uterine cancers. In additon, they can also be used in the treatment of animals such as dogs, cats and horses.
                                                                                                                                                                                                                                                      Novel antisense human fucosyltransferase sequences useful for treating cancer including breast, lung, gastric, renal and uterine cancer -
                                                                                                                                                                                                                                                                                                                           The present invention provides antisense oligonucleotides to the human

```
This sequence represents a PCR primer which is based on the rat RAP3 gene. The RAP3 gene and rap3 protein are involved in the regeneration processes of the liver, and the RAP3 gene is expressed specifically in the liver. The RAP3 gene is useful for designing PCR primers (such as the present sequence) and probes for detecting nucleotide sequences in a source material and as a marker of liver proliferation. The rap3 protein is useful for the diagnosis of liver regeneration and/or liver cell proliferation. Anti-rap3 antibodies, PCR primers and nucleotide sequences which act as probes are useful for detecting the occurrence of liver cell proliferation in a patient. Single stranded oligonucleotides that are complementary to RAP3 can be used as probes to detect the amount of mRNA transcribed from RAP3 present in a sample such as a liver biopsy, plasma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          RAP3; rat; liver regeneration; hepatic cell proliferation; liver biopsy; liver transplant; bioartificial liver; PCR primer; ss.
                               AAZ45854-71 represent PCR primers, derived from the human RAP3 CDNA sequence. The RAP3 (regeneration association protein 3) gene is involved in regeneration processes of the liver. The RAP3 gene was found to be upregulated 6 hours after partial hepatectomy, after which it is downregulated. The PCR primers are useful for detecting nucleotide sequences in a source material. The RAP3 cDNA sequence is useful as a marker of liver proliferation. The RAP3 protein is useful for the diagnosis of liver regeneration and liver cell proliferation. RAP3 antibodies, PCR primers and probes are useful for detecting the occurrence of liver cell proliferation in a patient. The RAP3 protein is also is useful for enhancing the growth of regeneration of liver tissue comprising treating the liver tissue such as extracorporeal or intracorporeal.
                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

              The probes can also be used for screening a liver cDNA or genomic library. The rap3 protein is useful for enhancing the growth or regeneration of liver tissue. The methods of the invention can be used establish the efficacy of therapeutic agents stimulating liver regeneration and for patients who have undergone liver transplantation and for monitoring patients treated with a bioartificial liver.
serum of a tissue or body fluid in comparison to a reference sample.

Modulating growth or differentiation of cartilage cells useful for treating chondrosarcoma, osteochondroma and arthritis in mammals

Example 6; Page 57; 90pp; English.

type and NRATP-/- cartilage cultures. The primers are used in the identification of the role that NPATP plays in cartilage cell growth and differentiation. The modulation of growth or differentiation of carriad out through contacting cells deficient in the NFAT family genes, with a test compound. Modulating growth or differentiation of cartilage calls can achieved by contacting the cells with a modulator of cartilage cells can achieved by contacting the cells with a modulator of NFATP activity, where the modulator comprises a peptidic compound derived from the calcineurin interacting region of NFATP. The methods of the invention are useful for modulating the growth useful for repairing bone defects and fractures in mammals including humans, monkeys, dogs, cats, mice etc. The compound that modulates cartilage cell growth and differentiation is useful for diagnosing cartilage cell growth and differentiation is useful for diagnosing chondroma, enchondroma, chondroblastoma, chondromyxoid fibroma, chondroma, enchondroma, chondroblastoma, fibrous dysplasia, ossifying fibroma, osteobalstoma, fibrous AAZ56049-Z56050 are used to amplify beta-actin from wild PCR primers

The present sequence is a human immunodeficiency virus (HIV) capture probe, labeled with ruthenium-tris(bipyridyl) label. The probe was used with HIV PCR primers (see ABN83651-52) in an example from the invention for the amplification and detection of HIV RNA in a plasma sample. The invention provides a method for the analysis of non-proteinaceous components, especially DNA and/or analysis of non-proteinaceous components, especially DNA and/or of the analysis of non-proteinaceous components in a biological sample. The sample is incubated with protease subtlissin 147 (see ABB76400) of Bacillus lentus variant 147 and the target DNA or RNA is then amplified by PCR and determined or detected. In the present example, the ruthenium-tris(bipyridyl) labeled capture probe provided a sensitive nonisotopic approach to detection based on electrochemiluminescence following specific hybridisation to biotinylated denatured HIV amplicons. The method is useful in environmental, food and medical analysis, e.g. to detect viral infection, and in molecular biological research, and can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Use of Bacillus lentus subtilisin 147 to analyze one or more target non-proteinaceous components from a mixture of non-proteinaceous amproteinaceous components derived from a biological sample useful e.g.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       nucleobases targeted to a nucleic acid molecule encoding human cytohesin-1, specifically hybridises with, and inhibits the expression of, human cytohesin-1, a quantum nucleotide exchange protein for ARF (ADP ribosylation factor). The antisense compound may be used in a pharmaceutical composition for inhibiting the expression of cytohesin-1 in human cells or tissues, and in treating a disease or condition associated with cytohesin-1 by administering to the human the antisense compound e.g. tumour or inflammation. The antisense compound is also useful for diagnostics, therapeutics, prophylaxis and a research reagents and kits. The present sequence is an antisense
                                                                                                                                                                                                                           Human cytohesin-1 coding region antisense oligonucleotide, ISIS#111004.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                             Human; antisense; cytohesin-1; guanine nucleotide exchange protein;

                                                                                                                                                                                                                                                                                                                                                                The invention relates to a novel antisense compound of 16-30 nucleotides targeted to any of 71 specified regions of the sequence that encodes human cytchesin-1 (CT1), where the compound hybridises and inhibits expression of human CT1. The compound of the invention has antisinflammatory, cytostatic, and anti-infective activity. The antisense compounds may have a use in antisense gene therapy. The antisense compounds are useful for treating or preventing disorders associated with expression of human CT1, e.g. infections, inflammation ABQ66432-ABQ66511 represent and diagnostic reagents. Sequences with 2'-MOB wings and a deoxy gap. The claimed sequences inhibit production of cytohesin-1 mRNA.

The invention describes a target non-proteinaceous component is analysed from a mixture of non-proteinaceous and proteinaceous components cerived from a biological sample by incubating the mixture with a protease having at least 80 % identity to the known amino acid sequence for subtilisin 147 from Bacillus lentus. The methods are useful for analysis of biological samples e.g. in medical, environmental or food analysis of biological samples e.g. in medical, environmental or food analysis of biological samples e.g. in medical, environmental or food analysis or in molecular biological research. They are especially useful in diagnostics e.g. to detect virus infections. They can be used to purify/isolate the component, the component come especially useful cacid, e.g. from a virus/microorganism. The methods can be used to purify/isolate the components useful as substrates in enzymatic reactions, or (in the case of mucleic acids) for sequencing as probes ctc. They can be used in high throughput formats, enabling analysis of large numbers of samples in a short time. Kits for undertaking the methods components and/or optionally lysis, washing and elution buffers are provided. This sequences represents a probe second in mish propersed to detect DNA sequences encoding themselves in an affinity to nucleic acids (especially preferred materials as above) this sequence represents a probe second in the preferred paterials are provided. This sequence represents a probe second in the professor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     MOL, G-coupled protein-receptor; cardiomyopathy; atherosclerosis; cell signal processing; metabolic disorder; diabetes; cancer; neurodegenerative disorder; immune disorder; cardiac disorder; lung disease; autoimmune disease; developmental disorder; antidiabetic; Cytostatic; Neuroprotective; Antiatherosclerotic; Immunosuppressive; Gene therapy; Vaccine; antidilammatory; PCR primer; 88.
                                                                                                                                               Use of Bacillus lentus subtilisin 147 to analyse a target non-proteinaceous component from a mixture of non-proteinaceous and proteinaceous components derived from a biological sample useful e.g. diagnostically to detect viruses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

This 3' primer and a 5' primer (see AAV47651) are based on an area of non-homology between murine protein tyrosine kinase 2 (PYK2) and focal adhesion kinase (FAK) that is adjacent to the C-terminus of the kinase domain. They were used in a PCR amplification of CDNAs of mouse osteoblastic MB1.8. The PCR product (700 bp) was used as a FAK-specific probe to isolate mouse FAK CDNA. The invention relates to new nucleic acid (see AAV47653) encoding mouse PYKZ (see AAW61196), a member of the FAK family. PYKZ can be used a claimed method for identifying specific modulators of PYKZ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Focal adhesion kinase; protein tyrosine kinase 2; PYK2 gene; mouse; podosome; related adhesion focal tyrosine kinase; cell adhesion kinase; ligand; monocyte; osteoporosis; inflammation; therapy; PCR; primer; ss.

AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their mucleotide sequences. AAZ69579 to AAZ7440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods of the sevelopment of characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human, diacylglycerol kinase beta, DAGKbeta, diacylglycerol, DAG, phosphatidic acid, DAG-dependent protein kinase C activation, mood disorder, epilepsy, neurodegenerative disorder; anxiety, schizophrenia, migraine, drug dependence; stroke, Alzheimer's dementia,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                PCR primers AAA63851-52 were used to amplify cDNA encoding full length human diacylglycerol kinase beta (DAGKbeta). DAGK converte diacylglycerol (DAG) to phosphatidic acid and attenuates DAG-dependent protein kinase C activation. Compounds that modulate the activity of DAGKbeta may be administered to a human patient for the treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         PCR primer used to amplify cDNA encoding full length human DAGKbeta.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 treatment.
N.B. The SEQ ID NOS 2852, 2913, 2974, 3035, 3096, 3157, 3227, 3297
and 3367, are not actually given a sequence in the Sequence Listing from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New human diacylglycerol kinase beta (hDAGKbeta) protein and its modulating compounds, useful for treatment of neurodegenerative and mood disorders -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human biallelic marker downstream amplification primer SEQ ID NO:10530.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This oligonucleotide is based on a non-homologous region, found adjacent to the C-terminal of the kinase domain, of murine protein tyrosine kinase 2 (PYK2) and focal adhesion kinase (FAK) sequences. It was used as a 3 primer, together with a 5' primer (see AAV49606), in the PCR amplification of mouse osteoblastic MB1.8 call cDNA. The PCR product was used as a PAK-specific probe to isolate full-length FAK cDNA. FAK shows homology to murine PYK2 (see AAW64568), another cell adhesion-dependent kinase. Agents that bind to and modulate PYK2 are isolated using methods of the invention, and are useful in treating osteoporosis and/or
                                                                                                                                                                                                                                                                                                                                                                                         Identifying agents that bind and modulate protein tyrosine kinase 2 - useful for inhibiting migration, adhesion or activity of monocytic cells, particularly for treatment and prevention of osteoporosis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human genome, biallelic marker; high density disequilibrium map; genomic map; haplotype; phenotype; polymorphic base; genotyping; haplotyping; hybridisation; identification; characterisation; amplification; SNP; PCR primer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

Nucleic acids encoding the novel KCNQ4 potassium channel subunit, useful e.g. for treating tinnitus, deafness, Alzheimer's and Parkinson's diseases Nucleic acids

Example 2; Page 24; 65pp; English.

Mutations in 3 known genes of the KCNQ branch of the potassium channel gene family underlie inherited cardiac arrhythmia's, neonatal epilepsy and in some cases associated with deafness. KCNQ4 has been mapped to the DFNA2 locus for autosomal dominant hearing loss, and a dominant negative KCNQ4 mutation that causes deafness in a DFNA2 pedigree has been identified. KCNQ4 is the first potassium channel gene underlying non-syndromic deafness. KCNQ4 forms heteromeric channels with other KCNQ channel subunits, especially KCNQ3.

Nucleotides encoding the KCNQ4 protein and the protein itself may be used in the prevention, treatment and diagnosis of diseases associated with inappropriate KCNQ4 expression. The nucleotides may cassociated with inappropriate KCNQ4 expression. The nucleotides may canso be used as DNA probes in diagnostic assays (e.g. polymerase chain reactions (PCR) to detect and quantitate the presence of similar nucleic acid sequences in samples and to identify mutations

within them, and hence which patients may be in need of restorative therapy. They may also be used to study the expression and function of the KCN04 polypeptides and their role in metabolism, for example the production of transgenic animals. The KCN04 polypeptides and the production of antibodies and to identify modulators (agonists and antagonists and to and activity. The anti-KCN04 antibodies and KCN04 expression and activity. They may be used to down regulate KCN04 expression and activity. They may be used to down regulate KCN04 expression and activity. They may be used in this way to treat tinnitus, loss of hearing (especially progressive hearing loss, neonatal deafness and presbyausis of the cantral nervous system (CNS) such as affective disorder, Alzheimer's dasase, anxiety, ataxia, CNS damage caused by trauma, stroke or neurodegenerative illness, cognitive deficits, compulsive behavior, dementia, depression, Huntingfon's disease, mania, memory impairment, memory disorders and dysfunctions, motion disorders, motor disorders, neurodegenerative disease, psychosis, schizophrenia, spinal cord damage, stroke and/or tremor. Conversely, antisense nucleic acid cord damage, stroke and/or tremor. Conversely, antisense nucleic acid cord damage, stroke and/or tremor. Conversely, antisense nucleic acid molecules may be administered to down regulate KCN04 expression by cord abmilifying KCN04 expression should appression there intronic primer pairs were used map the KCN04 expression. For a mail for a m (See AAA47619-A47646). This primer was used to amplify exon 5 and generated a 286 nucleotide fragment.

٥, target mutant Ras sequences in a DNA sample, involving the use of a thermostable restriction enzyme and primers shown in AAL47705-AAL47771. The method used is designated restriction mediated selection polymerase chain reaction (REMS-PCR). The method can be used to detect H-ras, K-ras and N-ras mutations, which may lead to cancer. The present sequence is a PCR primer useful in the method of the invention. present invention relates to a method of amplifying and determining Gaps ; Length 21; Indels DB 1; BP; 3 A; 9 C; 6 G; 3 T; 0 other; Score 15.8; DB Mismatches , 1.2%; 17; Conservative Sest Local Similarity

Novel polynucleotide of the endothelin/endothelin converting enzyme/receptors of endothelin and endothelin converting enzyme signaling system associated with cardiovascular disease, useful treating the disease

Example 6; Page 63; 190pp; English.

The invention describes a polynucleotide (1) of the endothelin (EDN) chackbull converting enzyme (ECE)/receptors of EDN and ECE (EDNR) signaling system which is associated with a cardiovascular disease. (I), the gene encoding EDN, ECE or EDNR (II) or a vector (III) expressing (II) or or (III) is useful for producing cells capable of expressing a molecular variant polypeptide which is associated with a cardiovascular disease. (II), (III), the EDN, ECE or EDNR polypeptide, or a cell expressing a molecular variant gene comprising (I) is useful for identifying and obtaining a pro-drug or drug capable of modulating the activity of a molecular variant of a polypeptide of the EDN/EDNR/ECE signaling system or its gene product. Or for identifying and obtaining an inhibitor of the activity of a molecular variant of a polypeptide of the EDN/EDNR/ECE signaling system or its gene product. The isolated proteins and polynucleotides encoding them are useful for preparation of a

pharmaceutical composition for treating a cardiovascular disease such as coronary heart disease, hypertension, atherosclerosis, or related to abnormal angiogenesis or fatty acid metabolism e.g. diabetes and familial hypercholesterolaemia. The gene or a polynucleotide fragment of the EDN/ECE/EDNR signaling system are useful as forensic markers, for creating a transgenic animal and in creation of a solid support comprising polynucleotides, genes, vectors, polypetides, antibodies or host cells of the invention. This sequence represents a PCR primer used to identify single nucleotide polymorphisms in DNA encoding cardiovascular regulator proteins of the EDN/ECE/EDNR signaling pathway. 88888888888

Example 6; Page 63; 190pp; English.

The invention describes a polynucleotide (I) of the endothelin (EDN) endothelin converting enzyme (EGE)/receptors of EDN and ECE (EDNR) signaling system which is associated with a cardiovascular disease. (I), the gene encoding EDN, ECE or EDNR (II) or a vector (III) expressing (I) or (II) is useful for producing cells capable of expressing a molecular variant polypeptide which is associated with a cardiovascular disease. (II), (III), the EDN, ECE or EDNR polypeptide, or a cell expressing a molecular variant gene comprising (I) is useful for identifying and obtaining a pro-drug or drug capable of modulating the activity of a molecular variant of a polypeptide of the EDN/EDNR/ECE signaling system or its gene product, or for identifying and obtaining an inhibitor of

```
the activity of a molecular variant of a polypeptide of the EDN/EDNR/ECE signaling system or its gene product. The isolated proteins and polynucleotides encoding them are useful for preparation of a pharmaceutical composition for treating a cardiovascular disease such as coronary heart disease, hypertension, atherosclerosis, or related to abnormal angiogenesis or fatty acid metabolism e.g. diabetes and familial hypercholesterolaemia. The gene or a polynucleotide fragment of the EDN/ECE/EDNR signaling system are useful as forensic markers, for creating a transgenic animal and in creation of a solid support comprising polynucleotides, genes, weetors, polypeptides, antibodies or host cells of the invention. This sequence represents a PCR primer used to identify single mucleotide polymorphisms in DNA encoding cardiovascular regulator proteins of the EDN/ECE/EDNR signaling pathway.
                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 21 BP; 1 A; 11 C; 3 G; 5 T; 1 other;

Determining an individual's risk for type 1 diabetes, comprises detecting the presence of an insulin dependent diabetes mellitus associated interleukin 4 receptor allele in a nucleic acid sample of the individual

Example 1; Page 32; 79pp; English.

The sequences given in ABQ80119-35 represent probes which were used to identify wild type and variant loci in the human interleukin 4 receptor (IL4R). These probe sequences were used in the method of the invention for determining an individual's risk for type 1 diabetes. The method comprises detecting the presence of an insulin dependent diabetes mellitus (IDDM)-associated interleukin 4 receptor

```
allele in a nucleic acid sample of the individual, where the presence of the allele indicates the individual's risk for type I diabetes.

The method identifies one or more single nuclectide polymorphism (SNP) within the ILAR gene listed in the specification. The method and the SNP's are useful for determining an individual's risk for type I diabetes. The ILAR SNP's are also useful for determining an individual's risk for any autoimmune disease or condition or any T helper type I mediated disease, e.g. rheumatoid arthritis, multiple sclerosis, inflammatory bowel disease, systemic lupus erythematosus, psoriaais, scleroderma, Grave's disease, systemic sclerosis myasthenia gravis, Guillain-Barre syndrome, or Hashimoto's thyroiditis.

Detecting nucleic acids in a sample for determining whether a cancer cell-containing test sample from a human has potential for tumour development, by using a THW nucleic acid down regulated in human tumours cells as probe -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is that of primer 312f6, which was used in the PCR amplification of cDNA derived from human melanowa metastasis cell line 530. The primer is based on a 301 pp clone obtained by differential display analysis of 530 cells. RT-PCR was performed to identify the 5' extended region of the cDNA. Human THW cDNA to identify the 5' extended region of the cDNA. Human THW cDNA to was obtained (see AA/T1013). THW is a tumour suppressor gene that shows downregulated expression in tumour cells. It is capable of suppressing tumour progression and/or metastasis, especially in determining whether a cancer cell-containing test sample has potential for tumour development, progression or metastasis involves determining the approximate level of hybridisation of a probect comprising the THW gene to the sample. A test sample having no or low potential for tumour progression or metastasis will have a high tumour progression potential or a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

invention

associated with muscle damage or dysfunction. This sequence represents a reverse transcriptase PCR primer used to isolate cDNA encoding exon 16 of the novel Myotonic dystrophy protein kinase DMPK isoform studied in the

The invention describes an isolated and purified polypeptide, comprising an amino acid sequence encoded by exon 16 of the myotonic dystrophy protein kinase (DMPK) gene. The invention is used to detect presence or risk of myotonic dystrophy, myocardial infarction or a condition

AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nuclectide sequences. AAZ695740 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other
                                                                                                                                Novel biallelic markers used to construct a high density disequilibrium
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         N.B. The SEQ ID NOS 2852, 2913, 2974, 3035, 3096, 3157, 3227, 3297 and 3367, are not actually given a sequence in the Sequence Listing from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    gene expression; reverse transcription; primer; cDNA; restriction enzyme; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                          Mycobacterium tuberculosis detecting hybridisation probe-PCR primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAT03277-T03280 are oligonucleotides which may be used for the detection of Mycobacterim tuberculosis in humans. They may be used either as labelled hybridisation probes or as polymerase chain reaction primers. The oligonucleotides allow direct, rapid and reliable detection of Mycobacterium tuberculosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human genome; biallelic marker; high density disequilibrium map; genomic map; haplotype; phenotype; polymorphic base; genotyping; haplotyping; hybridisation; identification; characterisation; amplification; single nucleotide polymorphism; SNP; PCR primer;

aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENSEE) files AAQ75547-0758) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression
                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      DNA encoding glycoprotein B of retroperitoneal fibromatosis and Kaposi's sarcoma associated herpes viruses - useful in vaccines for treatment of herpes infection or for detection of viral DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Claimed type 3 oligonucleotides (AAT84694-96) are specific non-degenerate oligonucleotides for the human Kaposi's sarcomassociated herpes virus (KSHV) DNA polymerase (GB). They can be used for detecting, amplifying or characterising KSHV polymucleotides encoding DNA polymerase (see AAT84697).
                                                                                                                                                                                                                 .;

Human, inflammatory bowel disease, Crohn's disease, ulcerative colitis, single nucleotide polymorphism; SNP; chromosome 19p13; paternity test; chromosome 5q31-33; forensic test; gene therapy; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     specific for polymuclectides encoding DNA polymerases from Kaposi's sarcoma herpes virus (KSHV). The oligonucleotide may be used for detecting viral DNA or RNA in a sample of primate origin, especially in the diagnosis of herpes viral infection. Herpes virus DNA polymerases of this invention, may be used in vaccinas for the protection against infection, may be used in vaccinas for the protection against infection by a herpes virus of the RFHV/KSHV family. They may also be used in the design and screening of anti-viral drugs. Antibodies raised against the polymerase or fragments of it, may be used in the detection of herpes virus infection and for drug targetting for the therapy of herpes virus

The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also observed in forensics, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification.

                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes a method for detecting the presence of polymorphisms associated with inflammatory bowel diseases such as ulcerative colitis and Crohn's disease. The methods can be used to detect the presence of genetic polymorphisms associated with inflammatory bowel disease and correlating their occurrence with disease states. They may be used in this way for phenotypic correlations, forensics, paternity testing, medicine and genetic analysis. The present sequence is a polymorphic site described in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; variant thrombospondin 1; variant thrombospondin 4; SNP; polymorphism; vascular disease; coronary artery disease; forensics; myocardial infarction; atherosclerosis; stroke; venous thromboembolism; pulmonary embolism; paternity test; ds.

These ORF8 encode polypeptides (see AAZ064437) which can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, nonendemic paratrachoma, and inclusion conjunctivitis; genital diseases such as mongenococcal uretritis, epidymitis, epidymitis, periodial periodial
                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
hyperplasia (CAH), or its transmission to children. CAH can be treated by protein or gene replacement therapy, which can also be used to prevent or treat hypercholesterolaemia.

A human adrenal cortex cDNA library was screened with a mouse StAR probe to isolate a 1.6 kb insert, including an ORF for a 285 residue protein. When it was cloned into pSPORT and expressed in COS-1 cells cotramsfected with pP450scc abd pADX, it increased the level of pregnenolone synthesis from cholesterol or

The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAY34584-AAY3589) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae nucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising epitope of C. pneumoniae.
                                                                                                                                                                                                                                                                                              Respiratory disease; pneumonia; bronchitis; heart disease; sarcoidosis; sinusitis; purulent otitis media; erythema nodosum; pharyngitis; vaccine; neutralising epitope; PCR primer; ss.

C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharymoidis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAX34584-AAX35879) can be used in immunogenic compositions as vaccines. Vectors containing C. preumoniae micleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising epitope of C. pneumoniae.
                                                                                   Respiratory disease; pneumonia; bronchitis; heart disease; sarcoidosis; sinusitis; purulent otitis media; erythema nodosum; pharyngitis; vaccine; neutralising epitope; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         PEBP2 alpha A gene expression regulating DNA PCR primer SEQ ID NO:16.

RESULT 61

```
The present invention describes DNA which participates in the regulation of expression of PEBP2 alpha A gene. The DNA produces a regulator protein with the activity of promoting bone formation and can serve as a promoter for prevention and treatment of bone diseases including osteoporosis. The present sequence represents a PCR primer used in an example from the present invention.
                                                                                                                                Katsumata T, Nakatsuka M;
                                                                                                                                                                                                    DNA regulating expression of PEBP2 alphaA gene to protein, useful as promoter for prevention or/and diseases e.g. osteoporogis
                                                                                                                                                                                                                                                               Example 2; Page 29; 118pp; Japanese.

Novel purified nucleic acid sequence encoding human calcium channel alpha2delta subunit protein, useful for detecting, preventing and treating cancer, stroke, brain trauma, Huntington's disease, myocardial

Example 7; Column 46; 77pp; English.

The invention relates to a purified nucleic acid sequence (referred as CACNA2D2 gene which encodes human calcium channel alpha2delta-2 subunit CACNA2D2 gene which encodes human calcium channel alpha2delta-2 subunit COPTOTENION COMPITION OF THE PROPERTY 1, 2 or 3 nucleic acid sequence, or its complement and the encoded proteins.

Also include are: (1) a method of producing a calcium channel protein.

Also include are: (1) a method of producing a calcium channel protein.

Which involves introducing a recompinant expression vector comprising the CACNA2D2 nucleic acids and encoding the calcium channel protein, into a cultured host cell under conditions such that the host cell expresses the amino acid sequences; and (2) a method for co-expressing calcium channel protein vector comprising out the method of (1), but with one or more than one expression vector comprising out the method of (1), but with one cor more than one expression vector comprising out the method of (1), but with one or more than one expression vector comprising out the method of (1), but with one or more than one expression vector comprising out the method of (1), but with one or more than one expression vector comprising out the method of (1), but with one or more uncleic acid is sequence encoding the splice variants. CACNA2D2 nucleic acid is cancer, stroke, brain trauma, Alzhaimer's disease, multinifarct dementia, cancer, stroke, brain trauma, Alzhaimer's disease, multinifarct dementia, sectoris, hypoxic damage to the cardiovascular system, ischaemic acid is useful as primers and probes for detecting presence of nucleic acid is useful as primers and probes for detecting presence of nucleic acid is common in cancer (e.g. undependent and phaladelt sequences) and cancer o preneoplastic lesion (e.g. hyperplasia, dysplasia, carcinoma in situ). The present is an SSCP (single strand change polymorphism) PCR primer used to detect polymorphisms in sequences encoding a human calcium channel alpha2delta splice isoform protein.

Novel purified nucleic acid sequence encoding human calcium channel alpha2delta subunit protein, useful for detecting, preventing and treating cancer, stroke, brain trauma, Huntington's disease, myocardial Gao B; Sekido Y, Duh F, Minna JD, SSCP; single strand change polymorphism. (USSH) US DEPT HEALTH & HUMAN SERVICES. Example 7; Column 47; 77pp; English. Wei M, 99US-0470443. 98US-114359P. Latif F, WPI; 2002-730574/79.

The invention relates to a purified nucleic acid sequence (referred as CACNA2D2 gene which encodes human calcium channel alpha2delta-2 subunit protein) comprising a fully defined alpha2delta splice isoform 1, 2 or 3 nucleic acid sequence, or its complement and the encoded proteins.

Also include are: (1) a method of producing a calcium channel protein or Also include are: (1) a method of producing a calcium channel protein or CACNA2D2 nucleic acids and encoding the calcium channel protein, into a cultured host cell under conditions such that the host cell expresses the amino acid sequences; and (2) a method for co-expressing calcium channel proteins, comprising carrying out the method of (1), but with one compression vector comprising one or more nucleic acid sequences encoding the splice variants. CACNASD2 nucleic acid is useful for producing a calcium channel protein. The recombinantly expressed for producing a calcium channel protein. The recombinantly expressed conspective (LEMS) (an autoimmune disease) and for identifying compounds cuseful for treating other diseases associated with abnormal calcium channel protein activity (e.g. epilepsy, migraine, episodic ataxia, cancer, stroke, brain trauma, Alzheimer's disease, multinfarct dementia, cancer, stroke, brain trauma, Alzheimer's disease, multinfarct dementia, seizures, Huntington's disease, ammesia, cardiac arrhythmia, angina pectorial protein my mycorrophic lateral system, ischaemic danage to the cardiovascular system; ischaemic danage or the cardiovascular system; ischaemic danage. to the cardiovascular system, myocardial infarction, congestive heart failure, muscular dystrophy and hypertension) CACNA2D2 nucleic acid is useful as primers and probes for detecting presence of nucleic acid sequence encoding at least a portion of calcium channel protein, in detection, identification and isolation of alpha2delta sequences disruption of 3221.3 region (in which the alpha 2delta gene is located is common in cancer (e.g. lung cancer and breast cancer) and in situ). preneoplastic lesion (e.g. hyperplasia, dysplasia, carcinoma in situ). The present is an SSCP (single strand change polymorphism) PCR primer used to detect polymorphisms in sequences encoding a human calcium used to detect polymorphisms in sequences en channel alpha2delta splice isoform protein.

The invention describes an isolated nucleic acid molecule (I) encoding a metalloprotease (MP-1). (I) is useful for preventing, treating, or ameliorating a medical condition, particularly an immune disorder, an ameliorating a medical condition, particularly an immune disorder, an abstract glutamate transport or motor neuron disorder, such as a methods are also useful for diagnosing, prognosticating, treating, ameliorating and/or treating disorders associated with MP-1 activity, e.g. diabetes, cancer, reproductive disorders (e.g. Kleinfelter's syndrome, genital warts, or germinal cell syndrome, or Cushing's syndrome, neurodecapencrative diseases (Alzheimer's disease, Parkinson's disease, Huntington's disease or Tourette syndrome), liver and renal diseases and immune disorders (e.g. Alzheimer's disease), liver and renal diseases and immune disorders (e.g. Alzheimer) and evalular, inflammatory and disease) mais conders (e.g. Alzheimer's disease (e.g. Alzheimer's disease (e.g. Alzheimer's disease (e.g. Alzheimer's disease) mais conders (e.g. Alzheimer's disease) mais disease (e.g. Alzheimer's disease) mais disease) for preventing, represents a primer associated with the novel New isolated nucleic acid encoding MP-1 protein, useful for preventin treating, or ameliorating diseases associated with aberrant metalloproteinase activity, e.g. immune, metabolic, inflammatory and Claim 16; Page 270; 473pp; English. neurological disorders -This sequence WPI; 2002-723329/78. disease)

The invention relates to a compound 8-50 mucleobases in length targeted to a nucleic acid molecule encoding casein kinase 2-alpha. The compound specifically bybridises with and inhibits the expression of casein kinase 2-alpha, or specifically hybridises with at least an stranse 2-alpha, or specifically hybridises with at least an 8-nucleobase portion of an active site on a nucleic acid molecule encoding casein kinase 2-alpha i.e. an antieense oligonucleotide.

Also included are: (1) a composition comprising the compound and a carrier or diluent; (2) inhibiting the expression of casein kinase 2-alpha in cells or tissues by contacting the cells or tissues with the convert compound; and (3) treating an animal having a disease or condition associated with casein kinase 2-alpha by administering to the animal the compound cited above so that expression of casein kinase 2-alpha is inhibited. The antisense compounds are useful for modulating the expression of casein kinase 2-alpha, e.g. conditions associated with expression of casein kinase 2-alpha, e.g. diabetes or hyperproliferative disorder, particularly cancer, such as breast cancer, prostate cancer, or liver cancer. The antisense compounds are also useful for diagnostics, therapeutics, prophylaxis, e.g. to prevent or delay infection, inflammation or tumour formation, as research reagents and kits, and in distinguishing between functions of New antisense oligonucleotides targeted to nucleic acid encoding casein kinase 2-alpha, useful in diagnostic and research applications, or for treating a disease or condition associated with expression of casein kinase 2-alpha -Claim 3; Page 95; 166pp; English.

tissues and is also useful for treating an animal having a disease or condition associated with C9, including a hyperproliferative, haematopoietic or cholesteroid disorder, bone metabolism disorder, stroke, brain injury or neurodegenerative disease. The compound is commonly useful as a research and diagnostics reagent. It is also useful to distinguish between functions of various members of a biological pathway. The invention is also be useful prophylactically e.g. to prevent or delay infection, inflammation or tumour formation. The antisense compound of the invention is often preferred over native form because of enhanced cellular uptake, enhanced affinity for nucleic acid target and increased stability in presence of mucleases. The present nucleic acid sequence represents one of a collection (ABK65249-ABK69186) of chimeric.
                                                                                                                                                                                                                                                                                                                                                                             phosphorothicate oligonuclectides having 2'-methoxyethyl (2'-MOE) wings. This sequence was used in the methods of the invention for inhibition
                                                                                                                                                                                                                                                                                                                                                                                                                                                caspase 9

Identifying target genes for allele-specific drugs - used for diagnosis, prevention and treatment of, e.g. cancers, atherosclerotic plaque, dysplastic lesions, endometriosis or graft versus host disease

Disclosure; Figure 7; 605pp; English.

potentially useful for treatment of cancer, where the inhibitor is active on a gene vital for cell growth or viability, and where the gene is subject to loss of heteroxygosity (LOH) in a cancer. The inhibitor is used for preventing the development of cancer in a patient having a precancerous condition, by administering to the patient a first allele specific inhibitor (ASI) targeted to an allele of a first essential gene This invention describes a novel method for identifying an inhibitor

where the normal somatic in the delis of the patient are heterozygous for the first gene, the inhibitor is active on at least one but less than all allelic forms of the gene present in a population and targets only one allelic form present in the normal sometic cells, and the first gene. The products and methods can be used in the diagnosis, prevention and treatment of LOH disorders, dysplastic lesions, benign tumours, endometriosis, polycystic kidney disease, and graft versus host disease. The method can also be used to remove malignant cells from bone marrow transplants. AAZ25812-Z26825 represent human polymorphic sites described in the method of the present in cells of the precancerous condition, invention. 8886666666666888

Antibodies specific for PRO polypeptides, used to diagnose and inhibit the growth of tumors in mammals, and to identify inhibitors of PRO polypeptide activity or expression -

Example 20; Page 126; 226pp; English.

The present invention describes an antibody that binds to a human protein (1) selected from: PRO381; PRO1269; PRO1410; PRO1755; PRO1780; PRO3434; PRO1927; PRO3567; PRO1293; PRO1303; PRO4444; PRO4354; PRO4397; PRO4407; PRO1555; PRO1096; PRO2038; and PRO2262. (1) has anticancer activity and can be used to diagnose tumours in mammals, by detecting complex formation when the antibody is contacted with test cells. Increased expression of genes encoding (1) can also be detected to diagnose tumours. Agents which inhibit the activity of (1), especially the antibodies, or an antisense oligonucleotide which

hybridises to genes encoding (I), can be used to inhibit tumour growth, perferrably by inducing cell death. Methods from the present invention can be used to identify compounds which inhibit the biological activity of (I). AAC58019 to AAC58102 represent PCR primers and hybridisation of (I). AAC58019 to AAC58122 represent PCR primers and hybridisation sequences. AAC58103 to AAC58122 and AAB24021 to AAB24040 represent human PRO polymucleotide and protein sequences given in the exemplification of present invention. the 1 88666666666

Novel human monoclonal antibodies which immunoreact with and neutralise human immunodeficiency virus useful for treating HIV infections

Example 8; Page 155; 366pp; English.

The present sequence is used in the production of anti-human immunodeficiency virus type 1 (HIV-1) antibodies. The invention relates to a human whole immunoglobulin (Ig) molecule which immunocates with HIV meture glycoprotein gpl20 preferentially over HIV precursor glycoprotein gpl20 preferentially over HIV precursor glycoprotein gpl20 and neutralises HIV and which reduces HIV infectivity titre in an in vitro virus infectivity assay by 50%, at a concentration of less than 700 mg/ml. The antibodies are used as reagents for the diagnosis and field isolates and provide useful information regarding the immunocherence of an immune response in HIV infected patients The concorpetence of an immune response in HIV infected patients The which can be used to screen human monoclonal antibodies to identify whether the antibody has the same binding specificity as the antibodies of the invention. The neutralising antibodies define new epitopes on the CR the invention. The neutralising antibodies define new epitopes on the immunotherapeutic human monoclonal antibodies. A major advantages of the monoclonal antibodies derives from the fact that they are encoded by a human polynucleotides sequence. Thus in vivo use of the monoclonal

antibodies for diagnosis and immunotherapy of HIV induced disease greatly reduces the problems of significant host immune response to the passively administered antibodies which is a problem commonly encountered when monoclonal antibodies of xenogeneic or chimeric derivation are utilized. An additional major advantage of the monoclonal antibodies described derives from the fact that they immunoreact with a unique determinant present on mature HIV glycoprotein gpl20. This class of antibodies is particularly effective at neutralising field isolates of HIV. 888888888888

Human neutralizing monoclonal antibodies to human immunodeficiency virus (HIV) used for providing passive immunotherapy to HIV are specific for glycoprotein-120

Example 8; Page 155; 374pp; English.

This sequence represents a polynucleotide used in the preparation of the antibodies of the invention. The invention relates to the production of an anti-HIV (human immunodeficiency virus) glycoprotein (gp)-120 monoclonal antibody capable of reducing an HIV infectivity titre in an in vitro virus infectivity assay by 50% at a concentration of less than 70 ng/ml. The method for the production of the antibody comprises:

(a) providing a first polynucleotide encoding a heavy chain immunoglobulin amino acid sequence (which does not comprise the sequence represented by ANY98206) and a second polynucleotide encoding a light chain immunoglobulin amino acid sequence; (b) inserting the first and second polynucleotide sequences into a host

acid (c) maintaining the host cell in conditions which allow the amino ac: sequences encoded by the polynucleotides to be expressed in the host

 \hat{cell}_{1} , and (d) isolating the antibody comprising the heavy and light chain

Immunotherapy to HIV in a human. They can be administered to high-risk patients to reduce the likelihood and/or severity of HIV-induced disease immunotherapy to HIV in a human. They can be administered to high-risk patients to reduce the likelihood and/or severity of HIV-induced disease and to patients who are already HIV-infected. The antibodies are used for neutralising filed isolates which provides information about the immunocompetence of an immune response in HIV patients, for detecting immunocompetence of an immune response in HIV patients, for detecting producing anti-idiotypic antibodies which can be used for active immunisation and to screen human monochonal antibodies to identify those with the same binding specificity and to monitor the course of HIV present in the body or in body fluids by immunoassay. The anti-HIV gp-120 monochonal antibodies are encoded by a human polynucleotide sequence and when used in vivo for diagnosis and immunotherapy of HIV processing when used in vivo for diagnosis and immunotherapy of HIV-incord disease

Novel synthetic polynucleotide encoding human papillomavirus (HPV) protein or mutated HPV protein useful as anti-HPV vaccines, comprises optimized-codons for expression of the viral proteins in human host

Example 4; Fig 19; 119pp; English.

The present sequence is an oligomer which was used in the assembly of one of a number of synthetic polynucleotides that encode a human papillomavirus (HPV) protein, or a mutated form of a HPV protein. The mutated HPV proteins have reduced protein function as compared to wild type proteins but maintain immunogenicity. The proteins compared codons

```
The invention describes a polynucleotide (I) of the endothelin

(EDN)/endothelin converting enzyme (BCE)/receptors of EDN and ECE (EDNR)

signaling system which is associated with a cardiovascular disease. (I),

the gene encoding EDN, ECE or EDNR (II) or a vector (III) expressing (I)

or (II) is useful for producing cells capable of expressing a molecular

cor (II), (III), the EDN, ECE or EDNR polypeptide, or a cell expressing

a molecular variant gene comprising (I) is useful for identifying and

cobtaining a pro-drug or drug capable of modulating the activity of a

molecular variant of a polypeptide of the EDN/EDNR/ECE signaling system

or its gene product, or for identifying and obtaining an inhibitor of

the activity of a molecular variant of a polypeptide of the EDN/EDNR/ECE

collaming system or its gene product. The isolated proteins and

polynucleotides encoding them are useful for preparation of a

plantmaceutical composition for treating a cardiovascular disease such as

coronary heart disease, hypertension, atherosclerosis, or related to

abnormal angiogenesis or fatty acid metabolism e.g. diabetes and familial
                                                                                                                                                                               0,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Endothelin; EDN; endothelin converting enzyme; ECE; endothelin receptor; EDNR; signaling system; cardiovascular disease; coronary heart disease; hypertension; atherosclerosis; angiogenesis; fatty acid metabolism; diabetes; familial hypercholesterolaemia; forensic marker; transgenic animal; solid support; cardiovascular regulator; SNP; single nucleotide polymorphism; PCR; primer; ss.
The polynucleotides are useful as
              vaccine which provides effective immunoprophylaxis against papillomavirus infection through stimulation of neutralising antibody and cell-mediated immunity.

enzyme/receptors of endothelin and endothelin converting enzyme signaling system associated with cardiovascular disease, useful Novel polynucleotide of the endothelin/endothelin converting signaling system assotreating the disease

Example 6; Page 63; 190pp; English.

The invention describes a polynucleotide (I) of the endothelin

(EDN)/endothelin converting enzyme (ECE)/receptors of EDN and ECE (EDNR)

signaling system which is associated with a cardiovascular disease. (I),

the gene encoding EDN, ECE or EDNR (II) or a vector (III) expressing (I)

or (II) is useful for producing cells capable of expressing a molecular

variant polypeptide which is associated with a cardiovascular disease.

(II), (III), the EDN, ECE or EDNR polypeptide, or a cell expressing

a molecular variant gene comprising (I) is useful for identifying and

obtaining a pro-drug or drug capable of modulating the activity of a

molecular variant of a polypeptide of the EDN/EDNR/ECE signaling system

or its gene product, or for identifying and obtaining an inhibitor of

the activity of a molecular variant of a polypeptide of the EDN/EDNR/ECE

signaling system or its gene product. The isolated proteins and

polymucleotides encoding them are useful for preparation of a

Coronary heart disease, hypertension, atheroscierosis, or related to abnormal angiogenesis or fatty acid metabolism e.g. diabetes and familial hypercholesterolaemia. The gene or a polynucleotide fragment of the EDN/ECE/EDNR signaling system are useful as forensic markers, for creating a transgenic animal and in creation of a solid support comprising polynucleotides, genes, vectors, polypeptides, antibodies or host cells of the invention. This sequence represents a PCR primer used to identify single nucleotide polymorphisms in DNA encoding cardiovascular regulator proteins of the EDN/ECE/EDNR signaling pathway. composition for treating a cardiovascular disease such as

Use of isolated gene transcripts - useful for developing products for the diagnosis, prognosis and treatment of cancers, particularly colon and pancreatic cancer

Claim 13; Page 68; 120pp; English.

AAX30947-31815 represent tag sequences of transcripts that are differentially expressed in colorectal cancer, in pancreatic cancer, or in both. The tag sequences can be used to identify genes by matching the tag sequences can be used to identify cons by matching the tag sequences can also be used in a method the tag sequences as probes to isolate unidentified genes from conn libraries. The tag sequences can also be used in a method for diagnosing colon or pancreatic cancer in a sample suspected of being neoplastic. The method comprises comparing the level of at least one transcript in a first sample of a tissue to a second at least one transcript in a first sample of a tissue suspected of being neoplastic and the second sample is a normal human colonic tissue. The transcript is identified by a tag selected from a tag selected from a second a second sample of a second sample of a tissue of the transcript is identified by a tag selected from a second a second sample selected from a second a second sample selected from a second selected s diagnosis, prognosis and treatment of cancer.

compounds including an interleukin-11 (IL-11) polypeptide, or its mimic, a compound that activates, or inhibits activation of the IL-11 receptor, or polynucleotide that encodes IL-11. The polynucleotides can be used in gene therapy to replace defective IL-11 or enhance IL-11 production in acute illnesses such as stroke. Agonists and antagonists of IL-11 can also be used in the manufacture of a medicament. This sequence represents a PCR primer used to study the induction of IL-11 in rat cerebral cortex following permanent middle
                                                                                                                                                                                                                                                                                                                                                                                                The invention describes a treatment for stroke or neuropathy using

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an isolated, purified human nucleic acid (I) that has the same sequence as a mRNA found in humans and is a SAGE (serial analysis of gene expression) tag comprising a single stranded probe containing at least 10 consecutive nucleotides. SAGE tags, are diagnostic and prognostic markers of cancer, especially of the colon and pancreas. AEX31900-ABX22770 represent human colon and pancreatic cancer

cancers, atherosclerotic graft versus host disease Identifying target genes for allele-specific drugs - used for diagnosis, prevention and treatment of, e.g. cancers, atherosc plaque, dysplastic lesions, endometriosis or graft versus host

Disclosure; Figure 7; 605pp; English.

This invention describes a novel method for identifying an inhibitor potentially useful for treatment of cancer, where the inhibitor is active on a gene vital for cell growth or viability, and where the gene is subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is used for preventing the development of cancer in a patient having a precancerous condition, by administering to the patient a first allele

```
ö
           present in cells of the precaptors of the first gene, the inhibitor is active on at least one but less than all allelic forms of the gene present in a population and targets only one allelic forms of the gene normal somatic cells, and the first gene. The products and methods can be used in the diagnosis, prevention and treatment of LOM disorders, e.g. cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic lesions, benign tumours, endometriosis, polycystic kidney disease, and graft versus host disease. The method can also be used to remove malignant cells from bone marrow transplants. AAZ2581-Z26825 represent human polymorphic sites described in the method of the

This invention describes a novel method for identifying an inhibitor potentially useful for treatment of cancer, where the inhibitor is active on a gene vital for cell growth or viability, and where the gene is subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is used for preventing the development of cancer in a patient having a precancerous condition, by administering to the patient a first allele specific inhibitor (ASI) targeted to an allele of a first essential gene present in cells of the precancerous condition, where the normal somatic cells of the patient are heterozygous for the first gene, the inhibitor diagnosis, prevention and treatment of, e.g. cancers, atherosclerotic plaque, dysplastic lesions, endometriosis or graft versus host disease Identifying target genes for allele-specific drugs - used for Disclosure; Figure 7; 605pp; English Stanton VP; Ledley FD, WPI; 1998-521232/44. Nucleic acid comprising single nucleotide polymorphisms, useful in forensics, paternity testing and diagnosis of disease -

Claim 1; Page 50; 96pp; English.

The invention relates to a nucleic acid comprising single nucleotide polymorphisms (SNPs) associated with diseases. The nucleic acids comprising the SNPs and probes and primers for detecting them may be used in assays for the diagnosis of diseases associated with SNPs (such as sickle cell anaemia, agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystroophy, Miskott-Aldrich syndrome, Pabry's disease, familial hypercholesterolaemia, polycystic kidney disease, hereditary spherocytosis, Von Willebrand's disease, tuberous sclerosis, hereditary haemorrhagic telangiectasia, familial colonic polyposis, Ehlers-Danlos

The present invention describes a novel enzymatic nucleic acid (ENA)
having a hammerhead motif (HM) comprising: (i) at least 5 ribose
cresidues; (ii) a 2 -C-allyl modification at position 4 of the ENA; (iii)
at least ten 2'-O-methyl modifications; and (iv) a 3'-end modification.

The ENA's can inhibit collagenase and stromelysin production in the
synovial membrane of joints for the treatment or prevention of arthritis,
particularly osteoarthritis or rheumatoid arthritis. The ENA's can also
be used to treat antigen presenting cells of a donor to induce tolerance
in a recipient to an alloantigen of a donor. They can also be used for
cenhancing graft tolerance or for treating autoimmune disease, and for
treating allergies and other inflammatory conditions. The ENA's can also
be used in diagnosis. Ribozyme therapy impacts on the expression of
expression which accompany treatment with retinoids and daxamethasone.

The concentration of ribozyme required to affect a therapeutic treatment
cis lower than that required of antisense molecules, and is highly
concentration of the present sequence is used in the exemplification of the

The invention relates to a novel nucleic acid molecule expressed in liver or stomach tissue, useful for diagnosing or treating obesity, anotexia etc. The nucleic acid molecule is useful as a diagnostic and therapeutic agent or as a target for agents which act as modulators and/or monitors of physiological processes associated with obesity, anotexia, weight maintenance, impaired muscle development, diabetes and/or metabolic energy levels and/or other physiological conditions. Alkylguanine alkyltransferase (AGT)-117, AGT-110, AGT-119, AGT-110, AGT-
tissue, useful for diagnosing or treating obesity, anorexia, diabetes or energy imbalance, and as targets for agents which act as modulators of physiological processes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        cochlear degeneration; hearing loss; deafness; retinal dystrophy; retinitis pigmentosa; combined rod cone dystrophy; obesity; animal model; transgenic animal; therapy; diagnosis; PCR; primer;

The novel cDNAs are mouse neurosensory defect associated gene family. The novel cDNAs are mouse form I (see AAA94630), human TUB form I (see AAA94633), human TULPI (see AAA94635), human TULPI (see AAA94635), human TULPI (see AAA94635), neuron TULPI (see TULP4 (see AAA94638). The novel coding sequences are useful as immunogens to raise antibodies that specifically identify TUB/TULP

                                     2.61F (AAT96652) and primer C13R (AAT96653) were used to obtain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Mammalian proteins expressed in retina and brain, useful for producing antibodies and for diagnosing neurosensory defects including cochlear degeneration, peripheral retinal degeneration and cone-rod retinal
                                                    a mouse tub gene probe DNA fragment for northern blots by amplifying mouse cDNA. Tub mutation is associated with adult onset obesity. Mouse Form I (see AAT96636) and Form II (see AAT96637) tub cDNAs have been isolated. Tub is a member of the mammalian TULP gene family associated with various defects in sensory neurons such as cochlear defects, retinitis pigmentosa and combined rod-cone
                                                                                                                                                                                                                                                                 Gaps

expressing cells and in drug screening assays directed at neurosensory defects. The novel proteins encoded by the present sequence can be used for the treatment of neurosensory degenerative conditions e.g. retinal dystrophies. The present sequence is a PCR primer used to isolate the novel genes of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1. Representative examples of ribozyme recognition sites are given in AAA884515 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme is resistant to endonuclease activity and hence is efficient in restenosis treatment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves RNA encoding a cyclin or cell-cycle dependent kinase other than CDKI, PCNA and Cyclin B1 -

The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme [1] which cleaves RNA encoding a cytokine involved in inflammation, matrix metalloproteinse (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule [11] comprising a promoter operably linked to a nucleic acid segment encoding [1]. [1] can have antipsoriatic, ophthalmological, cytostatic, antiseborrhaic, antidiabetic, antisickling, ophthalmological, vulnerary, keracolytic and virucide activities, and cleaves RNA encoding cytokine involved in inflammation. [1] can be used in gene therapy. [1] and [1] are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, squamous or basal cell carcinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, vircocetinopathy, sickle cell retinopathy, retinopathy of prematurity and reteinal detachment, and for treating and preventing more conversed.
                                                                                                                                                                                                                                                                                                                                                                                                                          Human; ribozyme therapy; hairpin ribozyme; hammerhead ribozyme; recognition site; target; ribozyme binding site; eye disease; vulnerary; proliferative disease; skin disease; psoritasis; diabetic retinopathy; cytokine; inflammation; cell-cycle dependent kinase; cyclin; MMP; matrix metalloproteinase; growth factor; reductase; scarring; cytostatic; dermacological; antiseborrheic; antidiabetic; virucide; antisickling; ophthalmological; ketatolytic; gene therapy; viral wart; atopic dermatitis; actinic keratosis; squamous cell carcinoma; basal cell carcinoma; basal cell carcinoma; basal cell carcinoma; basal cell carcinoma; contract of the content of the carcinoma; contract of the carcinoma; c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Treating proliferative skin or eye diseases and scarring, using ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1.1%; Score 14.8; DB 1; Length 19;

The present invention provides nucleotides encoding molecular variants of the human multi drug resistance-1 (MDR-1) protein. These can be used to identify compounds capable of treating multidrug resistance and sensitivity interfering resulting from polymorphisms in MDR-1, which can lead to difficulties in treating cancer, cardiovascular, neuronal, inflammatory and CNS diseases.
                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The sequences (AAQ52923-Q53037) are pref. herpes simplex virus target sequences for enzymatic RNA molecules. The RNA molecules are complementary to a substrate binding region in the specified gene target. They also have enzymatic activity, in that they specifically cleave RNA in the target. The ERMs interfere with viral replication and therefore have anti-viral properties. They can be used to attenuate viruses to be used in vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                              Macejak DG, Holecek JJ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Enzymatic RNA molecules - used to inhibit viral replication, infection and gene expression
